

# EuroKing E3 Community Offline

“Designed by midwives, for midwives”

## The Mobile Device solution for Community Midwives

EuroKing is the UK's leading maternity information systems provider, supporting around 40 NHS trusts across the UK and Ireland since 1984. EuroKing understands the demands and needs of maternity units, focussing on clinical safety and positive patient experience. The company's philosophy is to work with and support the NHS. Community Offline was designed by midwives for midwives, and is the result of direct collaboration with an NHS trust

EuroKing's core Maternity Information System, E3, supports the delivery of care in maternity units across the UK and Republic of Ireland and is now available in the community, as an offline solution. EuroKing E3 Community Offline can be used on Windows mobile devices by Community Midwives, linking seamlessly with existing E3 workflows. This enables all data to be viewed and captured offline, in a single system, and subsequently shared amongst numerous clinical environments once reconnected. The solution supports clinical safety, reduces workload for users and helps meet national requirements in the move towards digital working.

## Supporting Clinical Excellence in the Community

EuroKing E3 Community Offline enables midwives to download patient casenotes onto a Windows mobile device at the beginning of each day, ensuring the latest information is taken out on community visits. During each visit, the midwife can refer to the electronic patient records and update them, even when there is no internet connection. The E3 central maternity notes are automatically updated when a connection is made to the trust network via Wi-Fi, 3G/4G, or via trust based network points. The solution has been designed to fit in with existing hospital and trust infrastructure ensuring ease of implementation and ultimately, to support efficiency and cost savings in the community.

“ Staff are finding the solution easy to use and really helpful in caring for women outside of the hospital. ”

*Head of Midwifery, London*

As patient safety is paramount in maternity services, EuroKing is committed to developing E3 to provide a swift, accurate data entry facility, while at the same time enabling the Midwife to be back at the bedside with Mother and Baby. Synchronisation allows data to be updated to the system on return to the base, saving time and money and reducing CO2 emissions.

## **Saving Time and Enhancing Patient Safety**

- Access to key clinical information at the point of care
- Empowering clinicians in the community
- Increasing patient confidence and engagement
- Enabling more effective use of time and resources during community visits
- Supporting community based decision making and care delivery
- Limiting duplication of effort: creating a single, contemporaneous maternity record, independent of patient location
- Reducing the administrative burden associated with 'pen and paper' processes and reducing the margin for transcription error and double entry.

As maternity records are required to be retained for at least 25 years, all maternity data will be held securely within the system if ever required for review, including community notes - which can be retrieved swiftly in the event of a litigation claim.

## **Designed by clinicians, for clinicians**

A head of midwifery, using the solution in London says:

**"We really needed a solution that our community staff could use outside the hospital. We approached EuroKing about this requirement and we have subsequently designed, tested and implemented the solution together. As this has been completely designed 'by clinicians, for clinicians', it really ticks all the boxes for us. Staff are finding the solution easy to use and really helpful in caring for women outside of the hospital."**

Accessible on any Windows Mobile device, the software is secure and easy to use. It provides health professionals with access to patient information wherever they may be. The software may help to increase a community health professional's productivity and case knowledge, which ultimately leads to better and more efficient patient care.
